

Worship Card Integration Guide

1. Add to HTML file

html

```
<!-- Add this script tag after your other card scripts -->  
<script src="WorshipCard.js"></script>
```

2. Update your Scoring System

In your scoring calculation function, apply worship bonuses:

javascript

```
// In your calculateScore function or wherever you determine final favour  
function calculateFinalFavour(baseScore, handType, gameState) {  
    let finalFavour = baseScore.favour;  
  
    // Apply worship card bonuses  
    const worshipBonus = WorshipCard.getHandTypeBonus(gameState, handType);  
    finalFavour += worshipBonus;  
  
    // Apply other bonuses (jokers, etc.)  
    // ... your existing code  
  
    return finalFavour;  
}  
  
// Example integration in your main scoring:  
function scoreHand(dice, category, gameState) {  
    const baseScore = calculateBaseScore(dice, category);  
  
    // Apply worship bonuses  
    const worshipBonus = WorshipCard.getHandTypeBonus(gameState, category);  
    baseScore.favour += worshipBonus;  
  
    // Continue with your existing scoring logic...  
    return baseScore;  
}
```

3. Update Shop System

Add worship cards to your shop:

javascript

```
// In your shop generation function
function generateShopCards(gameState) {
  const shopCards = [];

  // Your existing shop logic...

  // Add random worship cards
  const availableWorshipCards = WorshipCard.getAllWorshipCards();
  const randomWorship = availableWorshipCards[Math.floor(Math.random() * availableWorshipCards.length)];
  shopCards.push(WorshipCard.createWorshipCard(randomWorship.handType));

  return shopCards;
}
```

4. Update Card Usage System

Handle worship card usage:

javascript

```
// In your card usage/play function
function playCard(card, gameState) {
  if (card.type === 'worship') {
    // Use worship card
    card.applyEffect(gameState);

    // Remove from hand/inventory
    removeCardFromInventory(card);

    return true;
  }

  // Handle other card types...
  // ... your existing code
}
```

5. Update Game State Initialization

Make sure game state includes worship tracking:

javascript

```
// In your game initialization
function initializeGameState() {
  return {
    // ... your existing state
    handTypeLevels: {}, // Track worship levels for each hand type
    // ... rest of your state
  };
}
```

6. Update UI Display (Optional)

Show hand type levels in your scorecard:

javascript

```
// In your UI update function
function updateScorecardDisplay(gameState) {
  const handTypes = WorshipCard.getAllHandTypes();

  handTypes.forEach(handType => {
    const level = WorshipCard.getHandTypeLevel(gameState, handType);
    const bonus = WorshipCard.getHandTypeBonus(gameState, handType);

    // Update your UI to show: "Ones (Level 3, +2 Favour)"
    const element = document.getElementById(`scorecard-${handType.toLowerCase().replace(' ', '-')}`);
    if (element && level > 1) {
      element.textContent += ` (Lv.${level}, +${bonus})`;
    }
  });
}
```

7. Save/Load Game State

Make sure worship levels are saved:

javascript

```
// In your save function
function saveGame(gameState) {
  const saveData = {
    // ... your existing save data
    handTypeLevels: gameState.handTypeLevels,
    // ... rest of save data
  };

  localStorage.setItem('gameState', JSON.stringify(saveData));
}

// In your load function
function loadGame() {
  const saveData = JSON.parse(localStorage.getItem('gameState'));

  return {
    // ... your existing load logic
    handTypeLevels: saveData.handTypeLevels || {},
    // ... rest of load logic
  };
}
```

8. Testing Integration

After adding these changes:

1. Test worship card creation:

```
javascript

const artemisCard = WorshipCard.createWorshipCard('Ones');
console.log(artemisCard);
```

2. Test level progression:

```
javascript

const gameState = { handTypeLevels: {} };
artemisCard.applyEffect(gameState);
console.log(WorshipCard.getHandTypeLevel(gameState, 'Ones')); // Should be 2
console.log(WorshipCard.getHandTypeBonus(gameState, 'Ones')); // Should be 1
```

3. Test scoring integration:

- Play a worship card
- Score that hand type
- Verify the favour bonus is applied

Key Files to Modify:

- **index.html** - Add script tag
- **Game.js** (or main game file) - Update scoring and state
- **Shop.js** - Add worship cards to shop
- **Card.js** - Handle worship card usage
- **UI.js** - Display worship levels (optional)

Let me know which specific files you have and I can provide more targeted integration code!
